

ANOTHER FALSE MAP TURTLE FROM THE
DISTRICT OF COLUMBIA VICINITY.

Dunn (1918, *Copeia*, No. 53, Jan. 25, p. 23), in a preliminary list of the reptiles and amphibians of Virginia, includes the False Map Turtle, *Graptemys p. pseudogeographica*. His record, based on a juvenile specimen in the United States National Museum (No. 45617), was collected by W. Palmer at Custis Spring, Arlington County, Virginia on June 28, 1901. In a later list of Virginia herpetofauna, however, Dunn (1936, mimeographed, Haverford, Pa., pp. 1-5) does not mention this subspecies. Moreover the range for this turtle as given by Stejneger and Barbour (1939, Check List of North American Amphibians and Reptiles, 4th Edition, p. 162) indicates that it normally occurs in the Mississippi Valley region. Thus while the occurrence of this subspecies in the District of Columbia region is apparently fortuitous, it nevertheless seems of interest to call attention to another specimen collected by the writer on May 18, 1940 in the tide marsh along the District of Columbia-Virginia shore of "Little River" opposite Roosevelt (formerly Anolotan) Island where it was associated with two other turtles, *Chrysemys p. picta* and *Sternotherus odoratus*.
